MARINE RADAR

and Technical Guide KX-G8100

Panasonic

When you refer to the serial number, write down all 11 digits. The serial number may be found on the label affixed to the bottom of the unit.

TABLE OF CONTENTS

Features	Circuit Board
CRT Display Safety Precautions	
Specifications	44.50
Location of Controls	
Installation and Connection	
Operations	
Important Notice	
Disassembly Instructions	
Water Resistant Check Points	
Maintenance	
Wiring Connection Diagram	Replacement Parts List

FEATURES

- 7-inch daylight bright high resolution display
- 1.5 kW power
- Easy view screen
- High-speed LSI graphic controller
- Screen (frame) memory
- 4-level target quantization
- Compact radome antenna
- Dual pulse rates and pulse lengths
- Two EBLs (Electric Bearing Lines)
- Two VRMs (Variable Range Markers)
- Echo freeze with auto return
- Inter-target distance measurement between two targets
- Off-center (an additional half radius in any direction)
- Flexible guard zone with audible alarm

- Multi-interval plotting to show the track of moving targets on the screen
- On-screen alpha-numeric readouts for Range, Rings, Distance, Plot, Interference Rejection, Expansion, Freeze, A.C.Rain, EBL and VRM
- 1.4 foot antenna
- Navigation Receiver interface (NMEA 0183 interface Format), LAT/Long, Vessel Speed, Range/Bearing to waypoint.
- Back Lighted Keypad
- Target Expansion at Ranges greater than 4 NM.
- 8 CRT Brilliance Levels
- Power Saving Mode for reduction of battery Consumption

CRT DISPLAY SAFETY PRECAUTIONS

X-Radiation

Warning: The only potential source of X-Radiation is the picture tube. However when the high voltage circuitry is operating properly there is no possibility of an X-Radiation problem. The basic precaution which must be exercised is to keep the high voltage at the following factory recommended level.

Note: It is important to use an accurate periodically calibrated high voltage meter.

- To measure the high voltage, connect a high voltage meter to the unit (⊕ to CRT Ground Strap and ⊕ to CRT anode).
- 2. Turn Brightness control fully counterclockwise (minimum brightness).
- 3. Measure the high voltage. The high voltage meter (electrostatic type) reading should indicate 12.0 kV± 1.0 kV.
- 4. If the meter indication is out of tolerance, immediate service is required to prevent the possibility of premature component failure.
- 5. To prevent X-Radiation possibility, it is essential to use the specified picture tube. Any attempt to substitute a tube of a different manufacturer or color can result in a serious X-Radiation hazard and component failure.

A general class FCC licence is required to service this product. Please refer all service to qualified service facility.

When you refer to the serial number, write down all 11 digits. The serial number may be found on the label affixed to the bottom of the unit.

SPECIFICATIONS

•ANTENNA

1. Type: 1.4 ft. (43 cm) (Nominal length)

Center-fed waveguide slot array, Enclosed in the radome

2. Rotation Speed:

24 r.p.m. nominal

3. Beam width:

Horizontal 6 degrees nominal

Vertical 25 degrees nominal

4. Side lobe:

21 dB

5. Polarization:

Horizontal

●TRANSMITTER

1. Modulation Type:

Hard Tube Type Modulator

2. Frequency:

9410±30 MHz, PON

3. Magnetron Type:

E3561 or Equivalent

4. Peak Power:

1.5 kW nominal

5. Pulse width and

0.1 µs/prf 2500 Hz (0.25 to 2 NM)

Repetition Frequency (prf): 0.5 µs/prf 1000 Hz (4 to 16 NM)

•RECEIVER

1. Type:

Super heterodyne

2. Intermediate Frequency:

60 MHz

3. Mixer and local OSC:

MIC (Microwave Integrated Circuit) with limiter

4. Duplexer:

Circulator

5. Noise Figure:

9 dB nominal

•MAIN UNIT (DISPLAY AND MAIN CONTROLER)

1. Display type:

Raster Scan, Daylight viewing

2. CRT:

7 inch Green Monochrome CRT Non-interlaced Scanning

3. Picture Quality:

Effective Diameter 3.74" (95 mm)

4. Range &

range rings interval:

Range	0.25	0.5	1	2	4	8	16
Ring	0.125	0.125	0.25	0.5	1	2	4

(Unit: NM)

5. Range Discrimination:

Less than 79 ft. (24 m)

6. Minimum Range:

Less than 98 ft. (30 m)

7. Range Accuracy:

1.1% or 33 ft. (10 m), whichever is the greater value

8. Bearing Accuracy:

1 degree

•POWER SUPPLY

1. Input Voltage:

10.8~42 V DC

2. Power Consumption:

54 W approx. (25 W approx. in saving mode)

3. Protection: Input Overvoltage

Reverse Polarity protection

•ENVIRONMENTAL CONDITIONS

1. Ambient Temperature:

-13°F to +158°F (-25°C to +70°C) for Antenna unit

+5°F to +131°F (-15°C to +55°C) for Main unit

2. Relative Humidity:

95% at 104°F (40°C)

3. Protection against Water:

Water resistant for Antenna unit Splash proof for Main unit

4. Wind Survival: Relative wind 100 knots

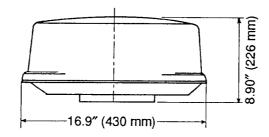

•COMPASS SAFE DISTANCE

Standard Compass		Steering Compass
Antenna Unit	3.6 ft. (1.1 m)	4.9 ft. (1.5 m)
Main Unit	1.6 ft. (0.5 m)	1.3 ft. (0.4 m)

•SIZE AND WEIGHT

1. Weight (Antenna): 12.6 lbs (5.70 kg)

2. Size:

- 3. Weight (Main unit): 11.8 lbs (5.34 kg)
- 4. Size:

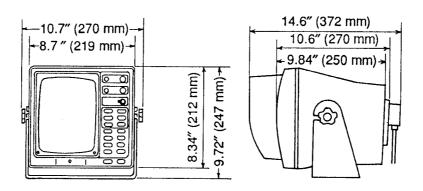

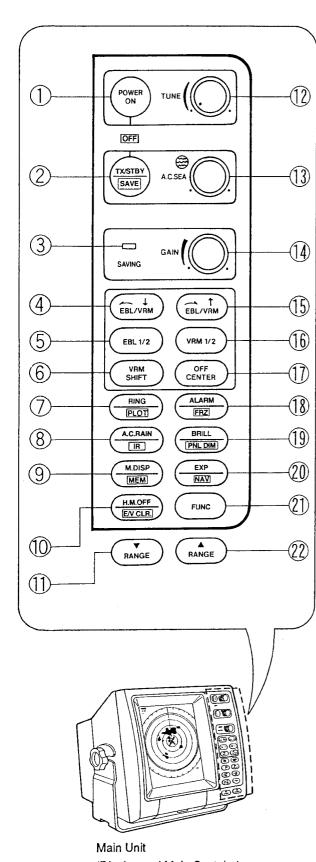

Fig. 1

Design and specifications are subject to change without notice.

LOCATION OF CONTROLS

(Display and Main Contoler)

① Power ON Button

Used to turn ON the power source. Press this and TX/STBY button simultaneously to turn off the unit.

②Transmit/Standby (Power Saving Mode) Button

Switches between Transmit/Standby modes. /Set the Power Saving Mode.

③Saving Mode Indicator

This indicator lights in green when the system is in the Power Saving Mode.

4 EBL/VRM Position Button

Used to measure the distance and bearing when the target is focused on by turning EBL counter clockwise and reducing VRM.

⑤ EBL1/EBL2 ON/OFF Button

Turns ON/OFF EBL1 and EBL2.

®VRM Shift ON/OFF Button

Displays a third VRM on the screen to measure the distance between two targets.

Tixed Range Ring Display/(Plot) Button

Displays/removes the fixed range rings./Displays sequential tracks of other vessels

® Anti Clutter Rain/(Interference Rejection) Button

Eliminates rain clutter reflection from the screen./Turns on and off the interference rejection (IR) mode when pressed after the FUNC button.

Memory Display/(Memory Storage) Button

Memorizes the current display or erases the memory./Recalls or eliminates the memorized display to or from the screen.

10 Heading Marker Off/(EBL & VRM Clear) Button

Temporarily removes the heading marker from the screen./Deletes EBL and VPM

11) Range (Down) Button

Reduces the range of measurement.

® Receiver Tuning Control Knob

Adjusts the receiver sensitivity to the transmitter.

Mnti Clutter Sea Control Knob Eliminates the unwanted echoes from the sea surface.

Eliminates the unwanted echoes from the sea surface

Receiver Gain Control Knob

Adjusts the receiver gain.

⑤EBL/VRM Position Button

Used to measure the distance and bearing by sighting the target with the clockwise turn of EBL and the enlargement of VRM.

16 VRM1/VRM2 ON/OFF Button

Turns ON/OFF the VRM1 and VRM2.

①Off Center Button

Shifts the position of your own ship 50% backward from the bearing indicated by EBL. This enables the user to observe a target located farther away.

(8) Guard Zone Alarm/(Display Freeze) Button

Sets or eliminates an alarm zone. When an alarm zone is set, the entry of an obstacle is informed with an alarm./Temporarily stops the display motion.

(9) Display Brilliance Control/(Panel Illumination Dimmer) Button

Adjusts the display brilliance./Adjusts the illumination of the control panel when pressed after the FUNC button.

@ Target Expansion/(Navigation Data Display) Button

Used for target expansion./When Navigation Receiver is installed, pressing this button displays the longitude and latitude of own position, range and bearing to a waypoint.

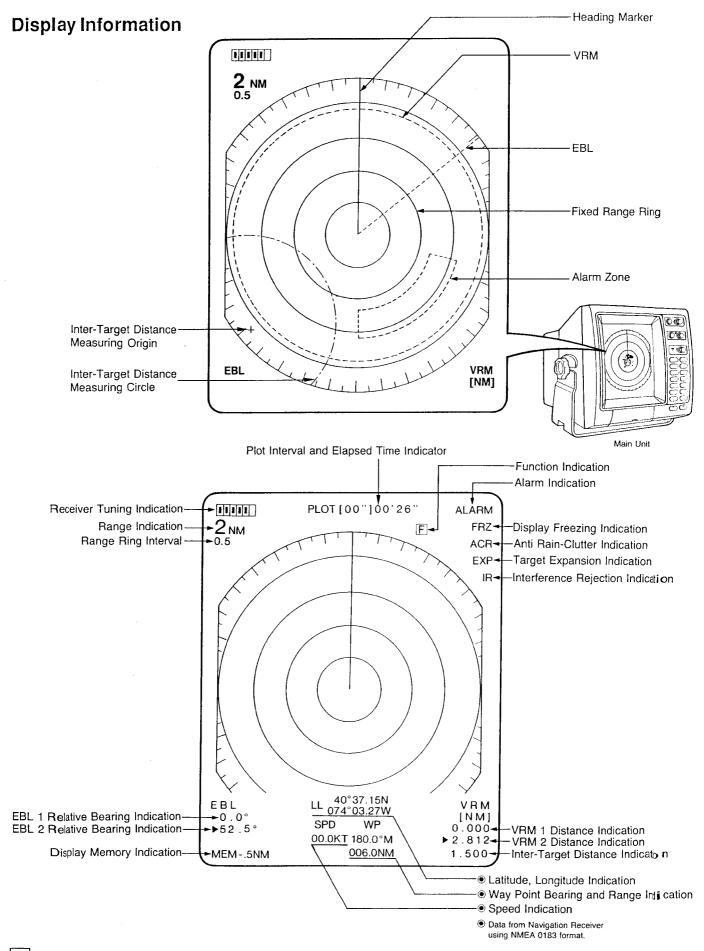

②Function Button

Allows the user to select a function shown in blue reversed print on buttons (2, 7), (8), (9), (6), (8), (9) and (9).

22 Range (Up) Button

Expands the range of measurement.

Fig. 2

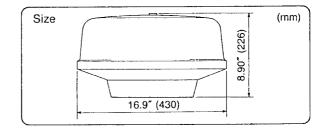

INSTALLATION AND CONNECTION

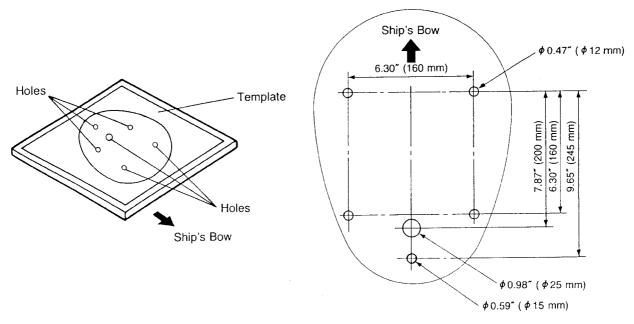

Mounting the Antenna Unit

MOUNTING PROCEDURE:

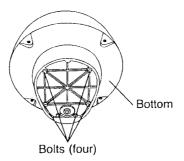

Refer to an installer for the installation of the antenna unit.

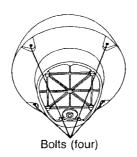

1. Drill six holes in the radar mounting position where the antenna unit is to be mounted using the included template.

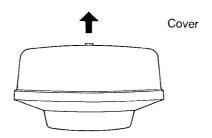

2. Remove the four bolts from the bottom of the antenna unit.

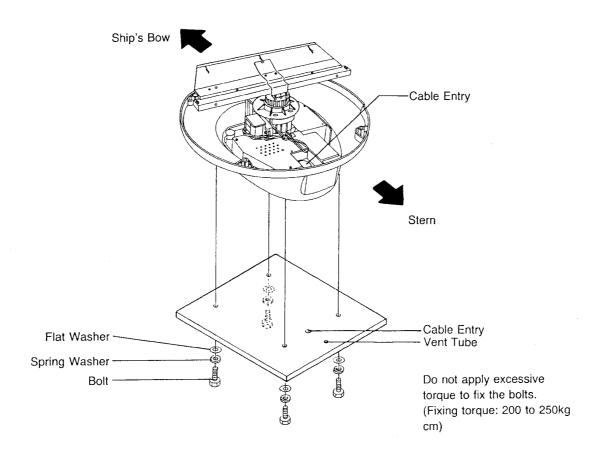

3. Loosen the four bolts at the bottom of the antenna unit.

4. Remove the cover, be careful not to damage the rubber gasket.

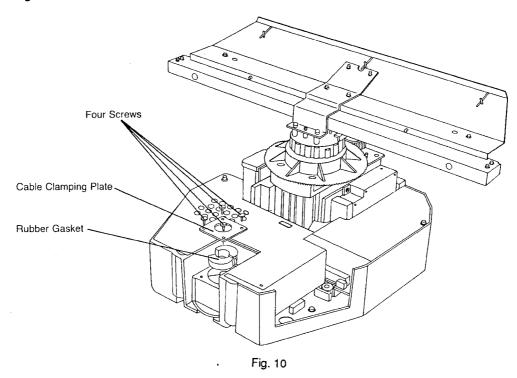

5. Install the antenna unit on the radar mount.

Make sure the antenna unit is installed in the proper direction relating to ships bow and stern. The cable entry must face in direction of the stern.

- 6. Remove the four screws from the cable clamping plate.
- 7. Remove the rubber gasket.

Cautions: Do not touch anything inside the transmitter cover. Do not arrow any iron or steel items to come near the magnetron.

- **8.** Run the cable through the hole at the bottom of the antenna unit through the rubber gasket and through the cable clamping plate and connect the three plugs from the cable to the jacks as follows.
 - 2-pin plug to CN 604 on the receiver PCB
 - 6-pin plug to CN 805 on the transmitter PCB
 - 5-pin plug to CN 803 on the transmitter PCB

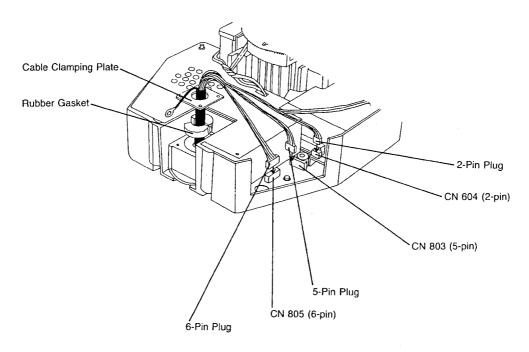

Fig. 11

9. Leaving one and half inch of the cable (before the break out) exposed above the clamping plate, replace the four screws and tighten down the plate.

Make sure the rubber gasket seals well around the cable.

To be tied the ground wire with screw as following picture.

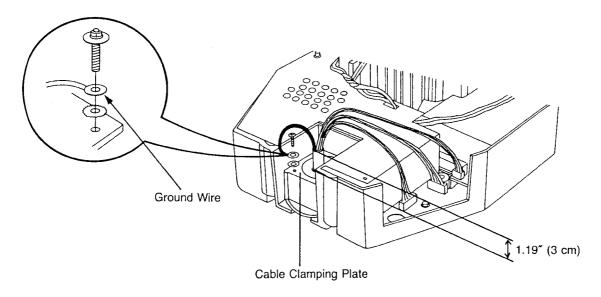

Fig. 12

NOTE:

Take care not to expose too much cable above the plate because it may be hit by the antenna.

Secure the cables with the plastic clamps.
 The clamps are to prevent the cables from hitting the antenna.

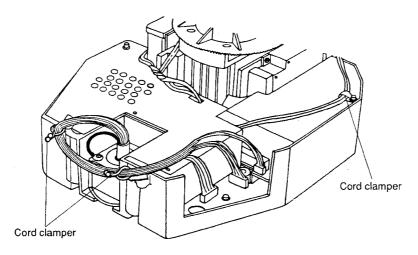

Fig. 13

11. Replace the antenna unit cover aligning the marks.

Tighten the bolts of the antenna unit cover temporarily. Secure them tightly after completing the Heading Adjustment (See page 57).

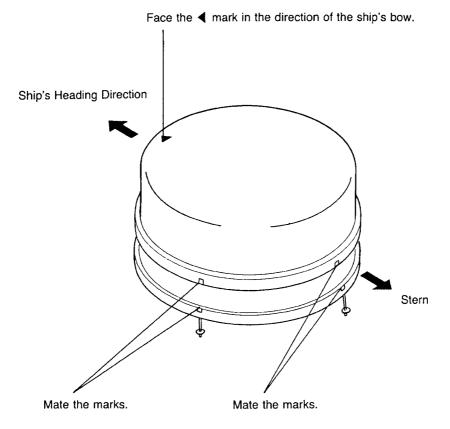

Fig. 14

Mounting the Main Unit

Mounting Procedure:

1. Mark five screw positions on the platform where the main unit is to be mounted using the template.

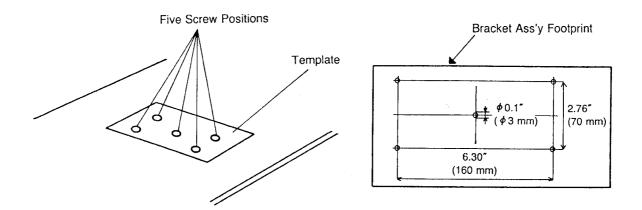

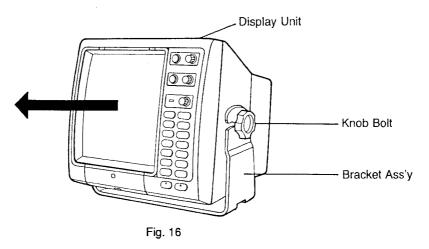

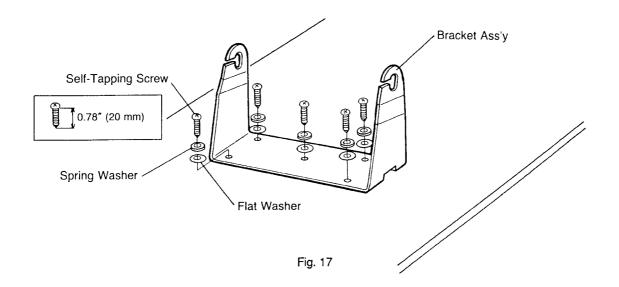

Fig. 15

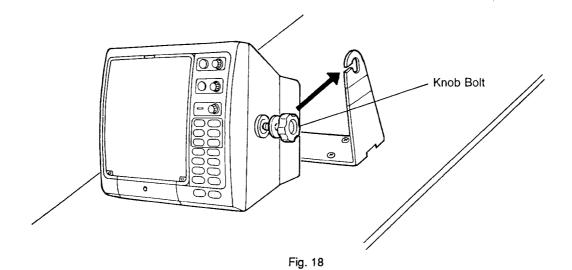

2. Unfasten the knob bolts and remove the display unit (in the direction of the arrow) from the bracket ass'y.

3. Install the bracket ass'y on the surface using the five screws (included).

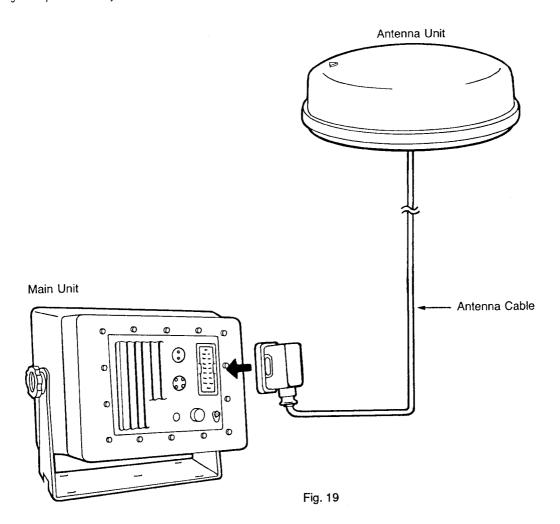

4. Re-mount the main unit on the bracket ass'y.

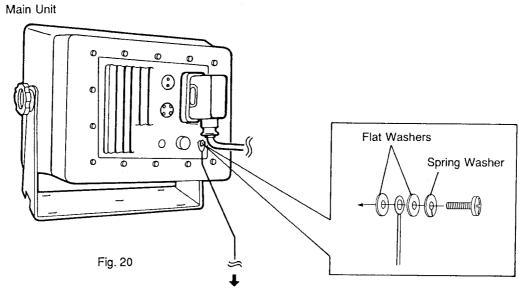

Connection

CONNECTING PROCEDURE:

1. Connect the cable from the antenna unit to the back of the main unit. Align the pins carefully.

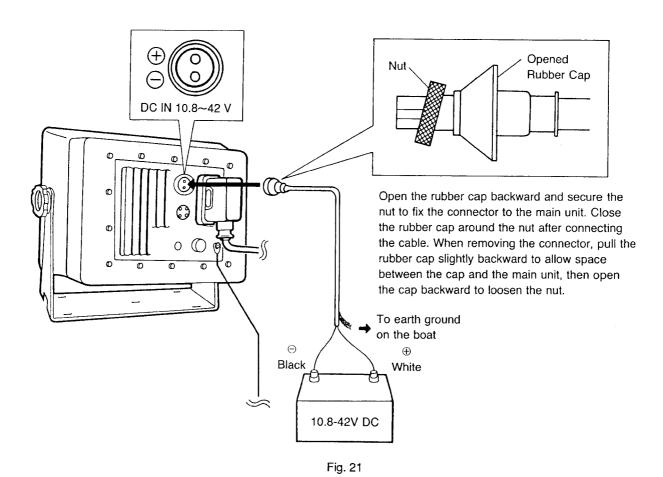

2. Connect the ground wire to the ground terminal at the rear of the main unit and connect the other end to the ground on the vessel.

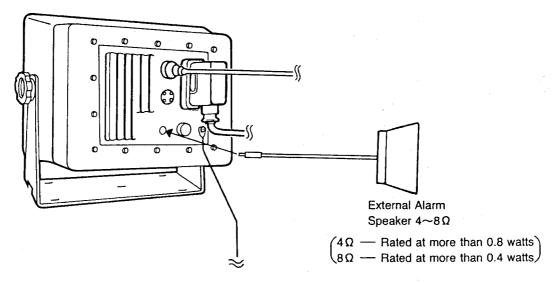

To the Vessel's Ground System

3. Connect the power cable supplied to the DC IN jack at the rear of the main unit and connect the other end to the DC battery (10.8 to 42V DC) and to the earth ground on the vessel.

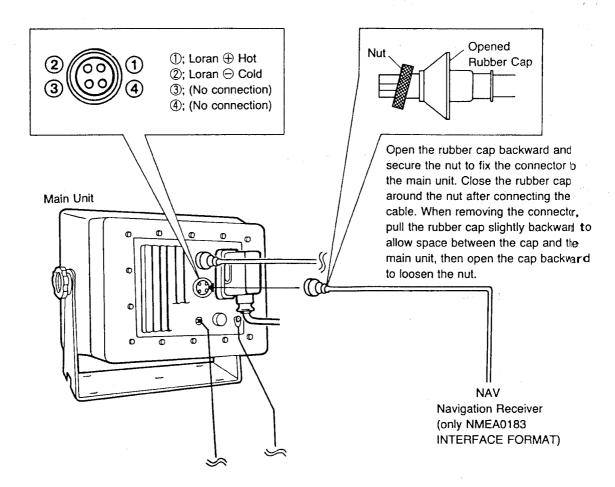

Installation Diagram (cont.)

4. External alarm speaker (4 to 8 ohm) can be connected to the main unit.
Connect the cord from the external alarm speaker to the EXT SP jack at the rear of the main unit.

Navigation Receiver (NMEA 0183 interface format only) can be connected to the main unit.Connect the cable from the Navigation Receiver to the NAV jack at the rear of the main unit.

OPERATIONS

Measuring	the Target
MEASURING THE RANGE TO TARGET WITH VRM.	1 Each press of to select VRM1 or VRM2 alternately. 2 Press (EBL/VPM) or (EBL/VPM) to move the VRM to the target. 3 Distance displays at the bottom right.
MEASURING THE TARGET BEARING WITH EBL.	1 Each press of to select EBL1 or EBL2 alternately. 2 Press (FELVIND) or (FELVIND) to adjust the EBL to the targets. 3 Bearing dsiplays at the bottom left.

Setting t	he Alarm
1 SETTING THE RANGE	Press (vm v2) to set an inner range and an outer range.
2 SETTING THE BEARING	Press to set the right and left bearing limits.
3 SETTING THE ALARM ZONE	Press ALANN to set the smaller area of sphere encircled, for a larger area setting, the second press within 2 seconds of the first one.

Outline of	Operation
1 THE POWER SOURCE TURNED ON.	Press until beep is heard. Warm-up begins with indication of time and wait for 1 minutes 30 seconds.
2 STARTING TRANSMITTER.	Press to start the transmitter.
3 CHANGING RANGE SCALE.	Press (NAMGE) or (NAMGE) to select the Radar Range.
4 ADJUSTING DISPLAY BRILLIANCE.	Press to select an appropriate brilliance of display.
5 ADJUSTING RECEIVER GAIN.	Turn of to make clear and distinct target images appear.
6 TUNING THE RECEIVER.	Turn to adjust the turning so as produce the clearest screen presentation.
7 ELIMINATING SEA CLUTTER OR RAIN/SNOW CLUTTER.	Turn to eliminate reflection echoes. According to the Sea and/or Weather conditions.

IMPORTANT NOTICE

If the transceiver module is placed on a steel workbench, great care should be taken to avoid deterioration of the magnetron mounted on the module. Follow the guidelines given in Fig. 24.

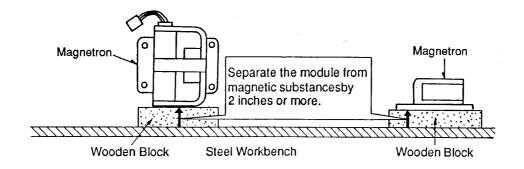

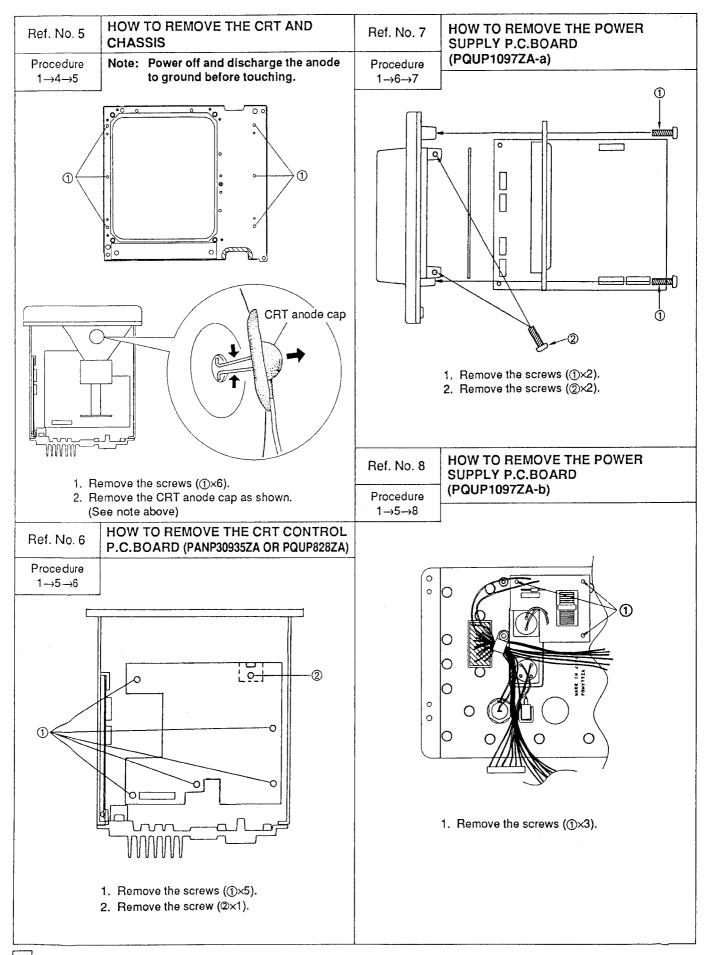

Fig. 24

MODEL KX-G8100MO

DISASSEMBLY INSTRUCTIONS

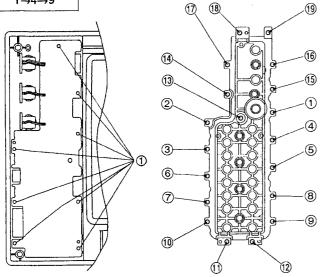

Procedure 1 1. Remove the knob bolts (①×2). 2. Remove the washers (②×2). 3. Remove the mounting bracket. Ref. No. 2 Procedure 1 1. Remove the Knob bolts (①×2). 2. Remove the screws (②×3). 3. WATER RESISTANT CHECK POINTS

First, check for wear, damage, or any sign of leakage of each rubber parts using the following table. Especially bold the faces are important checking points.

Model KX-G8100MO

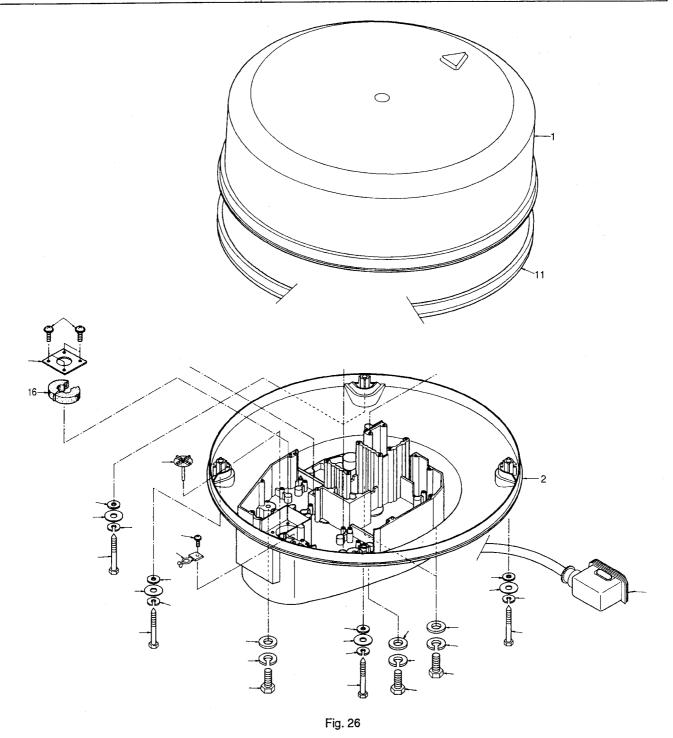

Leaky Point	Check Point	
Rubber Gasket (14) and Rear Cabinet (1)	Is rubber gasket (14) protruding and/or twisted?	
	Are fourteen screws tightened firmly?	
Antenna Cable Jack (39)	Are two screws tightened firmly?	
Power Supply Jack (36)	Is nut tightened firmly?	
Loran Interface Jack (37)	Is nut tightened firmly?	
Fuse Holder (42)	Is nut tightened firmly?	
Rubber Cap (32)	Is rubber cap (32) missing and/or twisted, or not?	
Chassis (65) and Heat sink (33)	Are two screws tightened firmly?	
Operational P.C.Board (PWB2)	Are nineteen screws tightened firmly?	
and Puch Switch (43)	Are push switches (43) protruding and/or twisted?	
CRT and Chassis (66)	Are four screws tightened firmly?	
Front Cabinet (2) and Chassis (66)	Are four screws tightened firmly?	
Rubber Gasket (12)	Is rubber gasket (12) protruding and/or twisted, or not?	
Variable Controls	Are nuts (28) tightened firmly?	
Rubber Cover (13)	Is rubber cover (13) missing and/or twisted, or not?	

Model KX-G8100DM

Especially bold type faces are important checking points.

Leaky Point	Check Point
Radome Upper Cover (1) and Radome Base (2)	Are four bolts tightened firmly?
Rubber Gasket (11)	Is rubber gasket protruding and/or twisted, or not?
Antenna Cable Bushing (16)	Are four screws tightened firmaly?

MAINTENANCE

General

The radar system should maintain optimum performance for a reasonably long period of time. Factory adjustment or alignment of circuits does not require frequent readjustments and realignments. However, continued performance can not be expected without periodic inspection and maintenance.

Periodically, a thorough inspection of the equipment should be made. Cable connections at terminal boards and connectors should be kept clean and tight. Be sure all ground connections are secure and properly grounded. Arrange all wires and cables in orderly manner to prevent the possibility of arc- over or short. Replace all wires that show signs of corrosion, cracking or deterioration.

All units of the equipment should be kept clean and free from corrosion. Replace all missing knobs and defective or broken parts. Housing, shields, covers and other protective devices should be at their proper place and secured.

Cleaning and Lubrication

Cleaning lengthens the operating life of the equipment. Dirt on components can result in shortcircuits. A dry, soft cloth and soft bristled brush are recommended for removing dirt from the outside of the unit. Dirt on the inside of the unit should be removed with a softbristled brush and removed by using a vacuum cleaner.

Hardened dirt should be removed by using a mild detergent and water solution on a cotton-tipped swab or a soft cloth. Avoid excessive use of water. Do not allow water to penetrate any parts. Avoid the use of abrasives and chemical agents.

Corroded areas should be cleaned with a neutralizing solution of 2% borax and water to prevent further corrosion.

CAUTION:

After cleaning, the sets should be carefully inspected for defects such as poor connections, damaged parts and loosened mechanical parts.

Keep all moving parts properly lubricated, using a cleaning type lubricant on shaft bushings. Do not over lubricate.

Apply grease to the fixing bolts securing the upper radome cover everytime the cover is opened.

Before maintenance work, be sure to remove the antenna cable connector from the display unit. When checking inside the units, wait for a few minutes until the high voltage compnents (CRT or HV capacitors) can discharge the residual charge.

Interval	Item	Check / Measures	Remarks
3 to 6 months	Exposed bolts and nuts on antenna unit	Check for corroded or loosened bolts/nuts. If necessary, clean them and repaint thickly. Replace them with new ones if heavily corroded.	* Sealing compound may be used instead of paint. * Put slight amount of grease if bolts and nuts are replaced. * Do not paint the radome.
	Radome	Check for dirt or crack on the radowe. Thick dirt should be wiped off by using a soft cloth immersed in fresh water. If any crack is found, apply slight amount of sealing compound or adhesive as first-aid treatment, then call for repair.	* Do not use plastic solvent (thinners or acetone) for cleaning. * Do not paint the radome.

Interval	Item	Check / Measures	Remarks
3 to 6 months	Connectors of P.C. Board in the antenna unit	Open upper radome cover to check connectors connections inside. Also check if the rubber gasket on the radome is in good order.	* When putting cover back in position, do not pinch flying wires.
	CRT screen	Dirt on this creates symptoms identical to poor sensitivity. Clean CRT surface, using special care not to scratch it.	* Use a soft cloth with a slight amount of anti-static-charge spray. Never apply plastic solvent.
6 months to 1 year	CRT anode and approach (Fig. 28)	High tension on the CRT attracts dust from the environment, and moist dust will cause poor insulation. Clean high voltage parts as follows. 1. Pull out anode cap and touch its nipple to chassis (discharging). 2. Clean CRT side and anode cap/lead using a soft dry cloth.	*If a crack is found on rubber cap or wire sheath, replace cap or wire with new one. *Always make sure anode cap is put back on CRT after cleaning.
	Connectors of P.C. Board in the main unit.	Check for loose connections. Clean contacts or replace plug, if necessary.

CIRCUIT OPERATIONS

1. BLOCK DESCRIPTION

Given below is a rough block diagram.

When the power ON key on the display unit is pressed, the preheating operation of the magnetron is completed after 1 min 30 sec, and the radar is placed in the standby mode. When the TX/STBY key on the display unit is pressed, TX trigger pulses are generated from the signal processor board inside the display unit, and these are sent to the transmitter in the scanner unit.

In the transmitter, 9410 MHz microwave pulse signals are generated in synchronization with the trigger pulses, and these are radiated from the antenna into space.

The reflected echo signal from the target is received by the same antenna and amplified in the receiver. The detected signal from the receiver is sent to the display unit where it is A/D converted and stored in the memory on the processor board. The write address of the memory is determined by the distance information (time elapsed from generation of transmission pulses) and antenna bearing data.

The video data read from the memory assigned by the horizontal/vertical address data of the processor board is sent to the CRT display circuit, and it is indicated at the required CRT position in synchronization with the horizontal/vertical signals from the processor board.

The characters, markers, EBL, VRM and other data are also displayed on the CRT in a similar way as the video signals.

Brief Block Diagram

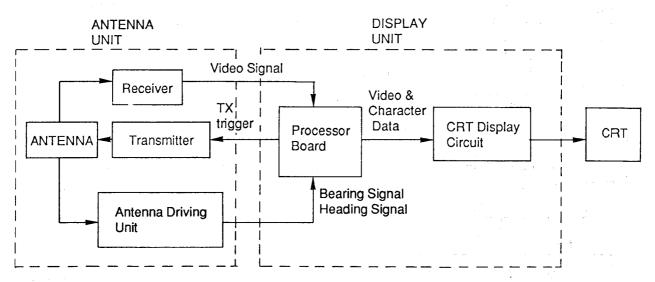

Fig. 32

2. CIRCUIT DESCRIPTION

2-1 Display Unit

Refer to the block diagram on the next page.

2-1-1 Processor board (PQUP1107ZA)

This board is composed of the 6 major blocks listed below.

- 1) Video Signal Processor / Character / Mark Generator
- 2) PLL Circuit
- 3) TX Trigger Generator
- 4) Clock Generator
- 5) Horizontal / Vertical Sync Pulse Generator
- 6) Alarm Circuit

1) Video Signal Processor / Character / Mark Generator

Circuit Operation:

The video signals from the antenna unit are supplied to the ACR (anti-clutter rain) circuit in order to reduce clutter from rain or snow. Only when the A.C. RAIN key on the display unit is pressed, the selector circuit is activated, and the video signals pass through the ACR circuit. After passing through the RC differentiation circuit in the ACR circuit, the video signals are sent to the EXP (echo expansion) circuit. When the FUNC + EXP keys on the display unit are pressed, the video signals are switched to pass through the EXP circuit by the selector circuit. In the EXP circuit, the pulses of the video signals are expanded, and the signals are sent to the A/D converter circuit, they are ranked as to their amplitude, they pass through the gate array circuit, and are stored in the primary SRAM (static RAM). The video data stored in the SRAM is moved into the DRAM (dynamic RAM). The DRAM address is assigned by the address gate array. The echo data of the assigned address written in the DRAM is parallel-serial converted by the serializer circuit in the gate array, and the data then passes through the D/A converter and is sent to the CRT module.

The character and mark data are generated by the GDC (Graphic Display Controler) and stored in the character DRAM. The DRAM character/mark data is converted into serial data, as with the echo data, combined with the echo data and then sent to the CRT module via the D/A converter circuit.

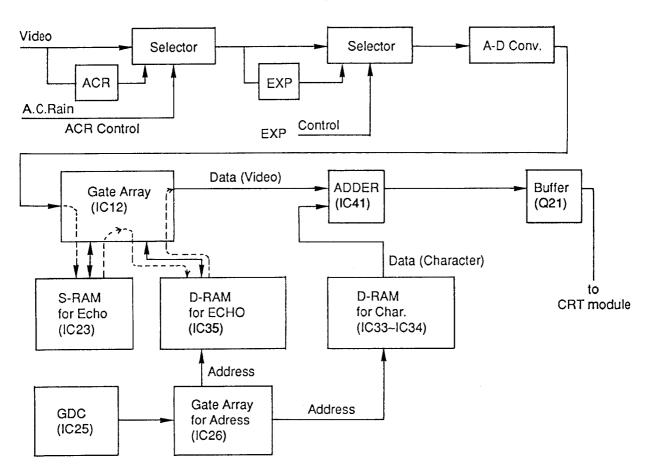

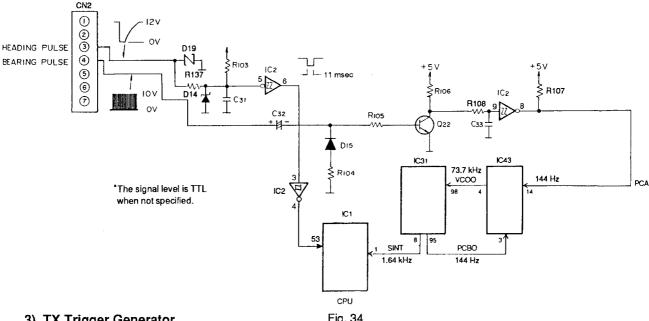

Fig. 33

2) PLL Circuit

Circuit Operation:

The bearing signal is multiplied from 360 pulses/rotation to 4096 pulses/rotation in the PLL circuit and sent to the CPU. The heading pulses are sent to the CPU via the shaping circuit. These pulse signals are used in the processing for the azimuth information.

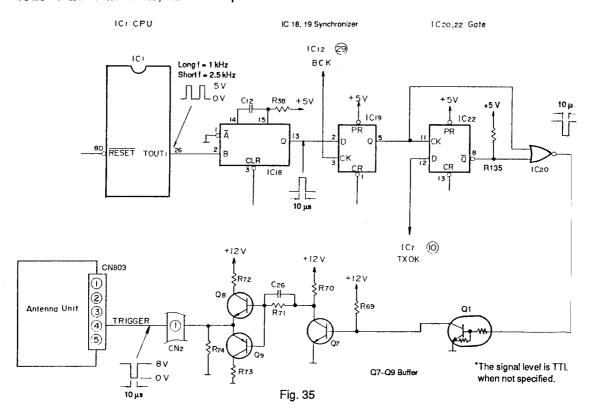

3) TX Trigger Generator

Fig. 34

Circuit Operation:

When the TX key on the display unit is pressed, TX trigger pulses are generated by the CPU, and the se are sent to the antenna unit via the synchronizing circuit, gate circuit and buffer circuit (Q7 ~ Q9). The TX trigger signal path is as follows:

IC1 pin26 \rightarrow IC18 pin2 \rightarrow IC18 pin13 \rightarrow IC19 pin2 \rightarrow IC19 pin5 \rightarrow IC22 pin11 \rightarrow IC22 pin8 ightarrow IC20 ightarrow Q1 ightarrow Q7 ightarrow Q8, Q9 ightarrow CN2 pin1 ightarrow Antenna Unit

4) Clock Generator

Circuit Operation:

The display unit has four reference clock generators. The 12.2 MHz is used for the CPU clock, the 21.0525 MHz generator for the time base for the SRAM, and the 62.16 MHz generator for the timing pulse for echo sampling, and 16.625 MHz generator for the display time base.

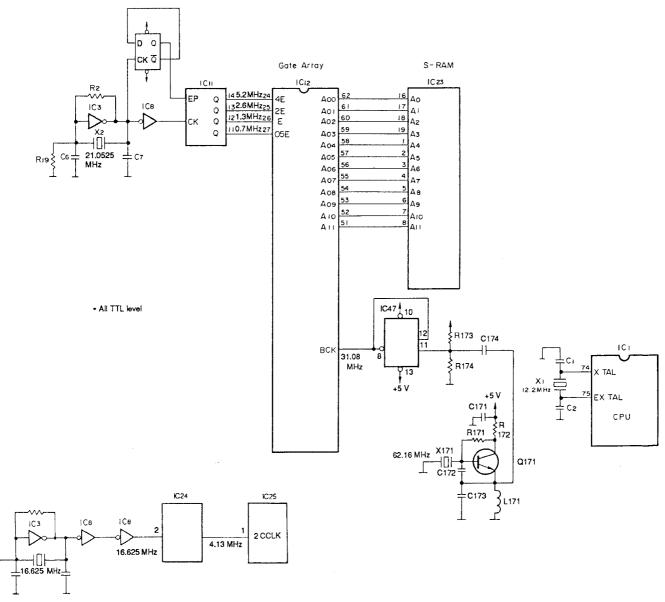

Fig. 36

5) Horizontal / Vertical Sync Pulse Generator

Circuit Operation:

The horizontal and vertical sync pulses are generated by the GDC and supplied to the CRT circuit.

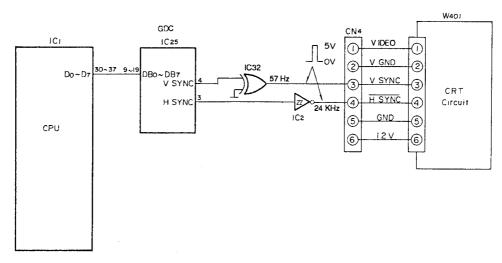

Fig. 37

6) Alarm Circuit

Circuit Operation:

The alarm zone corresponding to the alarm zone setting is set in the programmable counter. The signal indicating the alarm bearing zone is supplied from the CPU to the gate circuit.

When echo signals exist in the selected area, the output signal from the gate circuit (IC20, IC3) triggers the one-shot circuit, and a pulse of approx. 0.5 sec is generated. The 2 kHz audible clock signal is gated in the gate circuit, and it drives the buzzer in the display unit. The amplifier consisting of Q4 (Q23, Q24) serves to amplify the alarm signal supplied from the gate circuit and drive the optional externally connected speaker.

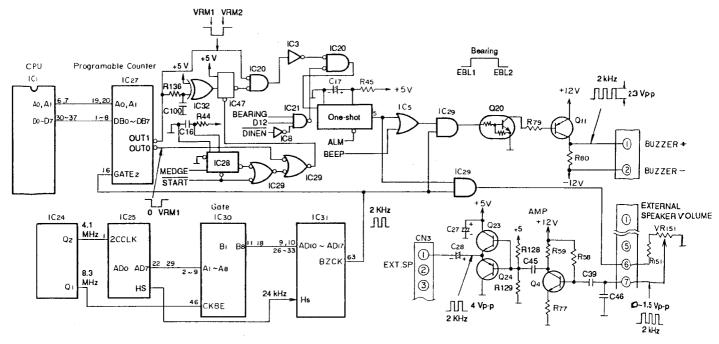

Fig. 38

2-1-2 CRT Display Circuit

Circuit Operation:

This circuit is composed as shown below in the circuit diagram. A general description of their functions and operations is given below.

- 1) Video amplifier: This amplifies the video signals sent from the signal processor to a level (approx. 40 V) which can drive the CRT tube.
- 2) Vertical oscillator output circuit: This allows a sawtooth wave current corresponding to the vertical sync signal to pass to the deflection yoke.
- 3) Horizontal oscillator output circuit: This allows a sawtooth wave current corresponding to the horizontal sync signal to pass to the deflection yoke. High-voltage generator circuit: This generates the high voltages required for CRT operation.

1) Video Amplifier

Circuit Operation:

The video signals sent from the signal processor have their voltage amplified to approximately 40V by the Q352 and Q351 cascade amplifier, after which the signals are supplied to the CRT cathode via R363 configure a circuit which protects the CRT center from shining and the phosphor from burning when the power is off.

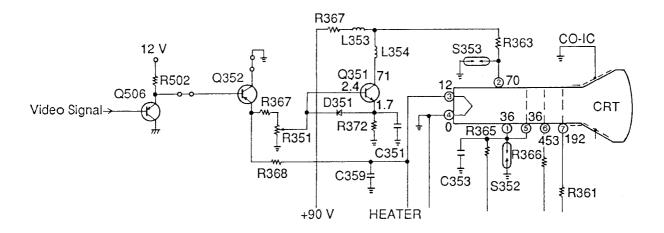

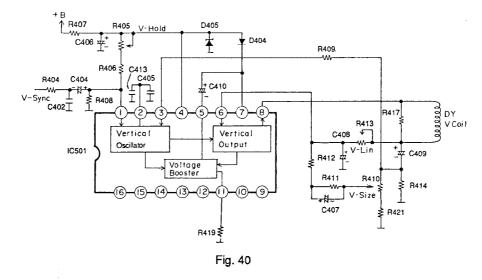

Fig. 39

2) Vertical Oscillator Output Circuit

Circuit Operation:

The vertical sync signal output from the signal processor is supplied to pin1 of IC501 via the low-pass filter consisting of R404 and C402. In the vertical oscillator circuit, sawtooth waveforms are generated as the charging voltage waveforms of C405, and these are sent to the vertical output circuit. The frequency of the oscillator circuit is determined by the bias voltage (pin1) adjusted by R405 and, if this value is within the determined range, it is locked by the V-SYNC signal.

The signal which is the output of the vertical oscillator circuit has its power amplified by the vertical output circuit, and it is output from pin 8. The current path is DY \rightarrow C409 \rightarrow R410, and R413 in the feedback path to pin 6 is a potentiometer for adjusting the linearity while R410 is for adjusting the deflection size. The feedback supplied to pin 3 via R409 is designed to stabilize the oscillator frequency.

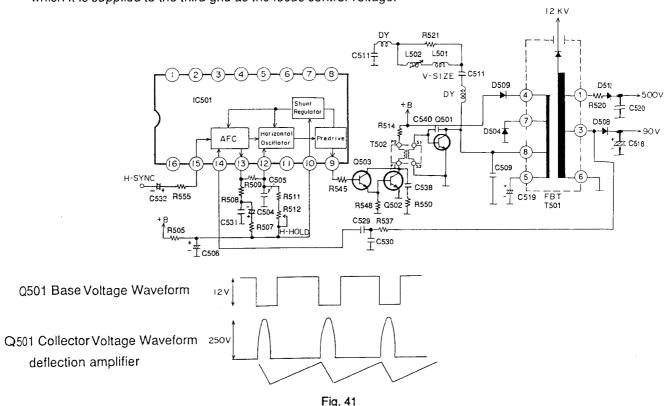

3) Horizontal Oscillator Output Circuit/High-Voltage Generator Circuit

Circuit Operation:

After it is output from the signal processor, the horizontal sync signal (H-SYNC) is supplied to pin 15 of IC501 via C532 and R558. The oscillator frequency of the horizontal oscillator circuit is stabilized by the H-SYNC signal and feedback signal (pin 14) from the flyback transformer (FBT), and after it has been amplified by the predrive circuit, it is output from pin 9. This signal has its polarity reversed by Q503, and it is sent to switching transistor Q501 via Q502 and T502 buffer. The Q501 collector resonates with 0509 and the FBT inductance components, and it generates pulses with a voltage of approximately 250V. Due to these pulses, a sawtooth current flows to the deflection coil, and a horizontal deflection magnetic field is generated.

The Q501 collector signal is sent to the FBT (flyback transformer) and it generates the 90V, 500V and 12kV voltages. The 90V line is used as the power supply for generating the signals which are supplied to the cathode, and the voltage is divided down by R452, R453 and R544 and sent to the first grid of the CRT. The 500V line is supplied to the second grid and further divided down by R520 and R531, after which it is supplied to the third grid as the focus control voltage.

2-1-3 Power Supply

Circuit Operation:

The inverter circuit consists of the switching regulator control circuit, power amplifier, switching circuit and output monitor circuit.

When the power key on the display unit is pressed, the power control circuit is activated and power is supplied to the switching regulator circuit. The switching regulator control circuit generates a pulse train with a frequency of approximately 90 kHz, and the pulse width is changed by the feedback signal from the output monitor circuit. The output pulse train from the switching regulator control circuit is amplified by the power amplifier, supplied to the switching circuit and used to control the switching of the power input to the transformer.

The power output of the transformer is rectified by the rectifier circuit, and the required DC voltages are obtained. When the DC output voltage has increased, the pulse width of the pulse train output from the switching regulator control circuit is reduced by the feedback signal from the output monitor circuit, and the DC output is reduced. This is how the DC voltage is kept constant.

When an overload occurs in the antenna unit, a protect signal is supplied from this unit to the protect control circuit to stop the operation of the switching regulator circuit, and shut down the power supply. When the FUNC + SAVE keys on the display unit are pressed, the display power control signal from the CPU is cut off, and the 12 V power for the CRT circuit is cut off via the SAVING CONT circuit to reduce the power consumed in the standby mode.

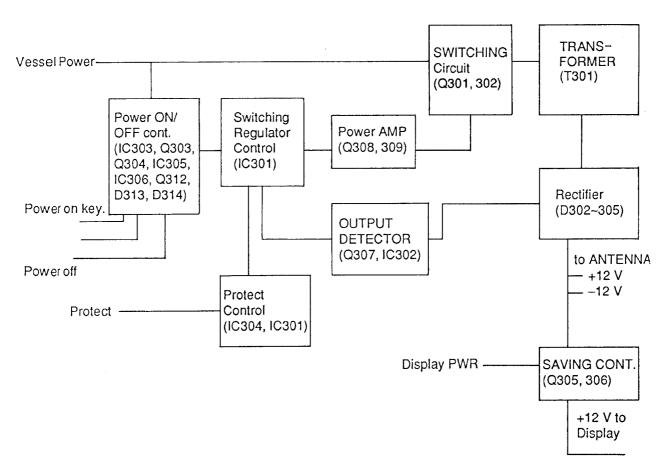

Fig. 42

2-2. Antenna unit

Circuit Operation:

Transmitter/Receiver P.C. Board (PQUP1005ZA)

This P.C. Board consists of the modulator circuit, pulse width control DC-DC converter, IF amplifier.

1) Pulse width Control

Circuit Operation:

When the trigger signal from the display unit is received, IC801 outputs the base signal for the pulse width from pin 4.

The pulse width is changed by Q812. The pulse width of long pulses is determined by the time constant of C802 and R805. In the case of short pulses, Q812 becomes ON, R836 is connected in parallel with R805, and the pulse width become narrower.

2) Modulator Circuit

Circuit Operation:

The base signal sent from the pulse width control circuit is amplified by Q803, Q804 and Q805 to the level necessary to drive FET Q806. Q806 switches +300 V from the rectification circuit which is then applied to T801. T801 steps up 300 V to 2 kV high voltage pulses and applies them to the magnetron.

By adjusting VR801, the gate voltage of Q806 will change, causing the rising speed of Q806 to change. In this way fine adjustment of the transmission pulse width can be performed.

The pulse current that flows into the magnetron is rectified by D804 and D805, and smoothed by C808 and R816. By measuring the resulting voltage, the current flowing through the magnetron can be checked.

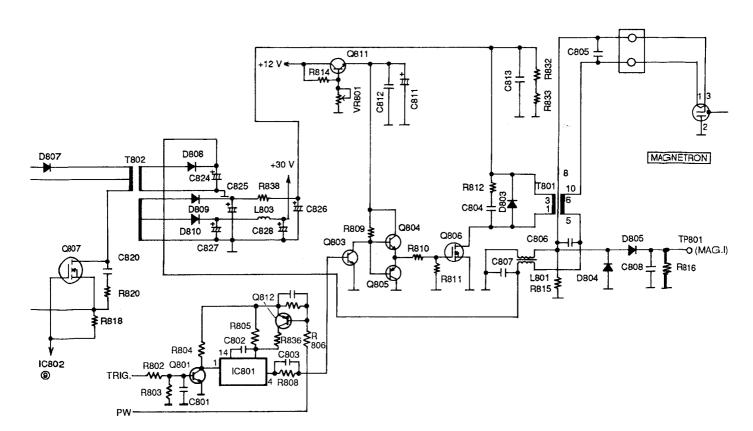

Fig. 43

3) DC-DC Converter

Circuit Operation:

This circuit generates the DC high voltages (300V) for the modulator and the DC power supply for the hearter of magnetron. It consists of the switching regulator control IC circuit (IC802), switching circuit (Q807), transformer (T802), and rectifier circuit (D808~D810).

The regulated +12V/-12V DC supply voltages are supplied to the primary winding of the transformer (T802) via the filter choke (L804) and switching FET (Q807).

The switching regulator IC (IC802) generates the pulse train with a frequency of approximately 45 kHz and a duty ratio of 45%, it drives the switching FET gate, and performs FET switching.

The pulse current flowing through the transformer primary winding is transferred to its secondary, it is rectified by the rectifier circuit, and both the 300V power supply for the modulator and the power supply for the magnetron heater are provided.

The DC power for the magnetron heater passes through the choke coil (L801) and secondary windings of the pulse transformer (T801), and is used to heat up the magnetron heater.

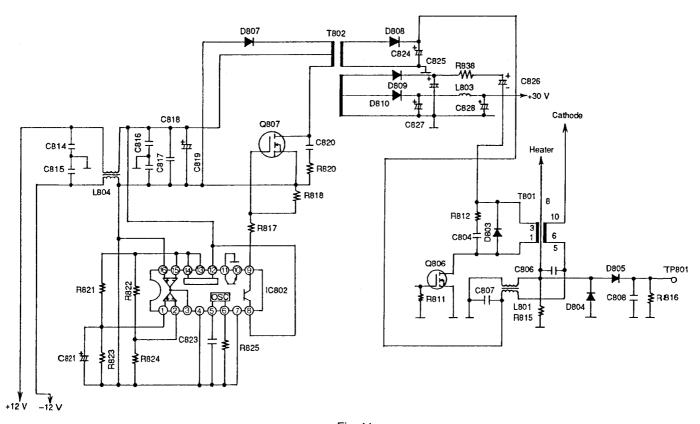

Fig. 44

4) Duplexer and Mixer

Circuit Operation:

A circulator is used to switch the transmit and receive signals of the radar.

The RF output from the magnetron is supplied to the circulator. The power supplied to the input port 2 of the circulator is fed to the antenna side port 3 of the circulator, it is passed to the antenna via the rotary joint, and is radiated into space.

The RF echo signals received by the antenna are supplied to port 3 of the circulator via the rotary joint. These signals are fed to port 1 of the circulator and then to the microwave integrated circuit (MIC). The MIC is a superheterodyne type receiver consisting of a limiter, mixer and local oscillator. The RF signals supplied via the circulator are supplied to the mixer stage via the limiter. The limiter serves to protect the receiver from excessive input signals supplied from the antenna. When excessively high input signals are supplied, they are reflected by the limiter.

The mixer serves to mix the 9410 MHz received signal with the local oscillator signal contained in the MIC, and it converts the resulting signal into a 60 MHz IF signal. This 60 MHz IF signal is sent to the IF amplifier.

The frequency of the local oscillator is controlled by the tuning control voltage so that an optimum IF frequency signal is obtained by manually adjusting the tuning knob on the display unit.

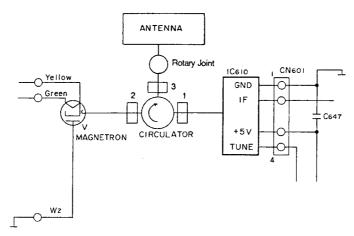

Fig. 45

5) IF Amplifier (PQUP1005ZA)

Circuit Operation:

The amplifier board consists of an IF amplifier (Q601, IC601), bandwidth selector circuit (Q603,Q604,Q612), post IF amplifier, detector, STC circuit (A.C.Sea clutter), tuning indicator circuit and tuning control circuit.

IF Amplifier Circuit

The received IF signal from the MIC (microwave integrated circuit) is amplified by about 20 dB by trans istor amplifier section (Q601) of the IF amplifier circuit, and is sent to IF amplifier IC601 via IFT (T601). It is amplified by about 35 dB by IC601 and sent to the bandwidth selector circuit in the next stage via IFT (T602).

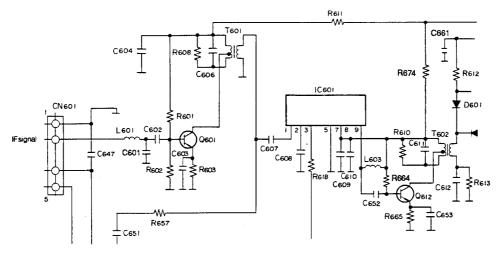

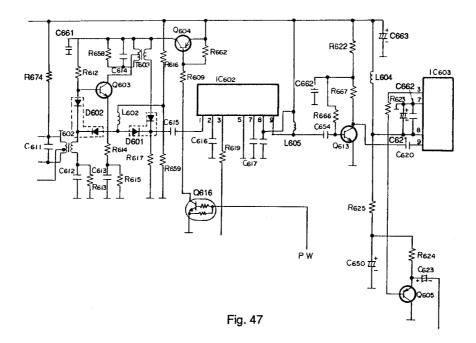

Fig. 46

Bandwidth Selector Circuit and Post IF Amplifier

The IF bandwidth of the IF amplifier is switched between approximately 8 MHz and 3 MHz, depending on whether the long or short pulse mode has been selected. In short pulse mode, the output signal from IF amplifier IC601 is connected to the next stage post IF amplifier via IFT (T602) and diode D602. The bandwidth on short pulse mode is set to approximately 8 MHz.

In the long pulse mode, transistor Q604 is driven into conduction by the PW signal from the display unit, the bandpass filter consisting of Q603 and T603 is overridden, and the bandwidth of the IF amplifier is set to 3 MHz.

The bandwidth selector circuit output is sent to the next stage post amplifier section (IC602) where it is amplified by about 35 dB, after which it is supplied to the detector circuit.

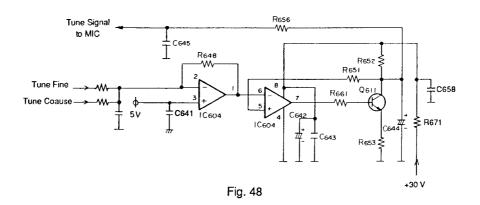

Detector Circuit (IC603, Q605)

The IF signal output from the post amplifier is supplied to IC603 where it is amplified by about 10 dB, it is detected by the detector circuit inside IC603 and converted into a video signal. The IC603 video output is sent to the display unit via buffer circuit Q605.

Local Ocillator Tuning Control Circuit (IC604, Q611)

The frequency of the local oscillator contained in MIC is adjusted using the tuning knob on the display unit. The voltages of the tuning signals (fine tune, coarse tune) from the display unit are converted by an adder circuit IC604 and transistor Q611, and a DC output of between about 3V and 22V is obtained. The tuning control voltage is supplied to the tuning pin of the MIC and it is used to control the oscillator frequency of the local oscillator in the MIC.

Tuning Indicator Circuit

Part of the IF preamplifier output is sent to narrow band amplifier Q606 via T601. Q606's collector circuit is connected to a 60 MHz tuned circuit (C626, T605). The IF signal from the tuned circuit are detected by the diode detector circuit (D605, 606) and sent via Q607 to the display unit as the tuning indication signal. When the IF signals have a frequency of 60 MHz, the output level of the tuning indicator reaches its peak (approx. 2 VDC); when the frequency has shifted by about 2 MHz, the output voltage decreases to half level. In the display unit, the tuning condition is indicated on the display on the basis of this voltage.

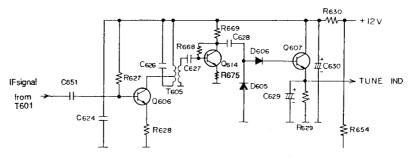

Fig. 49

6) Signal MPX Circuit

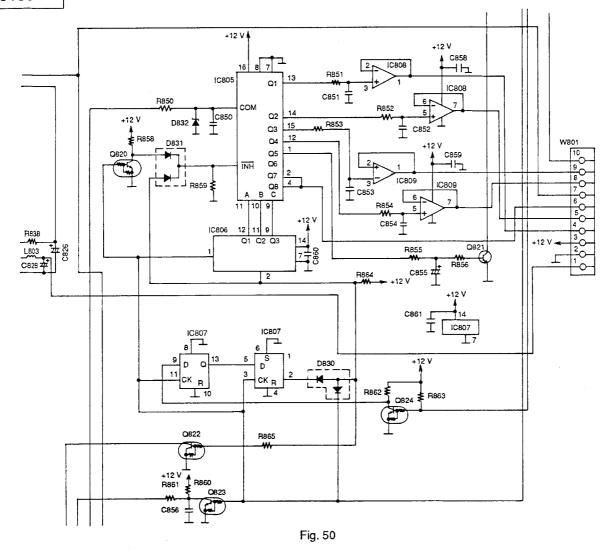

Circuit Operation:

The control signals TUNE FINE, TUNE COARSE, GAIN, ACS, PW, and TUNE IND from the display unit are converted in synchronism with the bearing signals from the antenna unit (approx. 144 Hz), and sent in multiplexed form as one data signal.

The various control signals are extracted from this data signal by the analog switch, IC805, sample-heldin IC808 and IC809, and output.

The output from IC805 is converted by bit 3 of the output from IC806, and the heading signal from the heading sensor is passed through buffer Q824, synchronized with the bearing signal in IC807, and used to reset the counter.

The heading signal is output to buffer Q822, and the bearing signal passes through buffer Q823 and is output at the display section.

ADJUSTMENTS

General

Table 1 lists the adjustment Method required for the adjustments below which are to be performed in addition to the adjustments undertaken when the radar system is installed.

These adjustments should be made when;

- a. Major components have been replaced
- b. An adjustment error is suspected to be the cause of trouble

Table 1 Adjustment Points and Ratings

Adjustment Block	Adjustment Item	Adjustment Point	Check Point & Rating	Remarks
Power Supply Board of Display Unit	Output Voltage	VR302	CN301 pin6 12 VDC (12.1~12.2 VDC)	4-9
CRT display	Horizontal oscillator frequency	R512	Pin 9 of IC401: 24.325 kHz (23.825~ 24.825 kHz)	4-12-2
board	Vertical oscillator frequency	R405	Adjust so that no screen sync misalignment occurs.	4-12.3
	Screen centering Centering magne		Adjust the screen center to within 1/16" of the CRT center.	4-12.1

Adjustment Block	Adjustment Item	Adjustment Point	Check Point & Rating	Remarks	
CRT display	Horizontal width	L501	Screen width: 325/32"~315/16"		
board	Vertical size	R410	Screen height: 49/16"~423/32"		
	Vertical linearity	R413	x1, x2: 17/8"~131/32" y1, y2: 29/32"-211/32"	4-12.4	
	Brightness	R510	Operation: Maximum gain, maximum brightness; adjust to level at which the retrace can not be seen.	4-12.5	
	Focus	VR531	Adjust for optimal image display.	4-12.6	
IF amplifier board	Bandwidth Do not adjust (factory-set)	T601, T602, T603, T604	Adjustment Tuning display level		
		T605	Adjust the level to its maximum in the optimum tuning state.		
Processor board	Picture level adjustment	VR1	IC13 pin 12 level: 0.35~0.40 VDC	4-10	
Adjustment board	External speaker volume adjustment	VR151	Optimum level with external speaker connected	4-8	
	Tuning display adjustment	VR152	Adjust to display 5 indicators in the optimum tuning state.	4-7	
	Range reference adjustment	VR153		4-2	
	Tuning adjustment	VR154	Adjust so that the optimum picture is achieved with the front panel tuning knob at the center position.	4-1	
	Gain adjustment	VR155	Adjust so that 60% to 80% of the screen is buried by noise signals.	4.4	
	A.C.Sea	VR156 (at 12NM range)	Operation: Set the ACS and GAIN controls to their maximum positions. Adjustment: Set for a sensitivity change point of 6NM.	4-7	
	Heading adjustment	VR157	Adjust so that the echo from a target dead ahead is aligned with the 0° bearing.	4-3	
Antenna unit	Heading adjustment	Mechanical Adjustment		4-3	

Adjustment on Installation

The following adjustments should be made at the time of installation.

- 4-1 Tuning Adjustment
- 4-2 Range Reference Adjustment
- 4-3 Heading Adjustment
- 4-4 Gain Preset Adjustment
- 4-5 Tuning Indicator Adjustment
- 4-6 Magnetron Current (Check Only)
- 4-7 A.C.Sea Adjustment

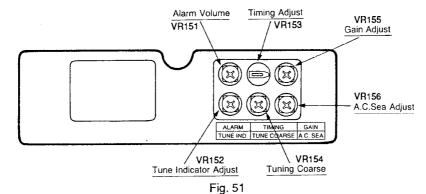

4-1 Tuning

If the best tuning condition is not obtained with the TUNE control set at its mid- travel, execute the following procedure.

Note: This adjustment is also required when replacing the MIC (microwave integrated circuit) or magnetron.

Procedure:

- 1. Transmit with the radar on the 3 n.m. range with the TUNE control and A.C.Sea set at its mid-position gain at 2 o'clock and wait about 10 minutes for magnetron oscillator to stabilize.
- 2. Remove the adjustment cover on the front panel of the display unit.
- 3. Adjust VR154, located on the adjustment board, so that a comparatively weak echos from long range targets are discerned with maximum definition.

4-2 Range Reference Adjustment

The reference timing differs with respect to the length of the signal cable. Perform the following adjustment.

- 1) Set the radar at the 0.25 n.m. range to receive echos.
- 2) Visually select a straight object, e.g., a harbor wall, straight pier, etc.
- 3) Adjust VR153 on the ADJUSTMENT board so that the straight object appears straight with no pushing" or "pulling" near the center of the picture. See Fig. 52.

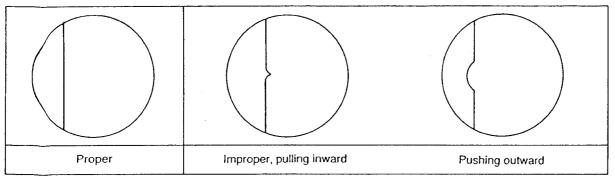

Fig. 52

4-3 Heading Adjustment

Procedure:

- 1) Operate the radar to obtain a normal display.
- 2) Select a proper target echo (small island, end of quay, etc.) located on the heading line direction and near the edge of the screen.
- 3) Set the EBL line to the target, Measure the bearing.
- 4) Read out the vessel's bearing from the compass, and using a navigational chart find the relative bearing of the target from the vessel's heading.
- 5) If there is a difference between them adjust the position of the Heading Sensor Board (heading detector) as shown Fig. 53.

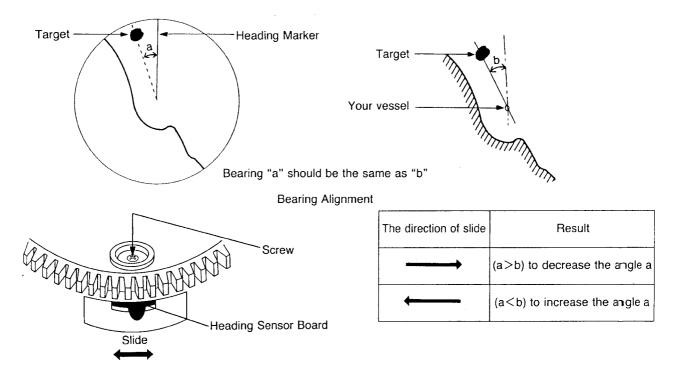

Fig. 53.

4-4 Gain Preset Adjustment

Operate the radar and turn the A.C. Sea clutter knob counterclockwise as far as it will go. When the gain knob has been rotated clockwise as far as it will go, proceed with the following adjustment if noise signals do not appear on the CRT screen.

Procedure:

- (1) Operate the radar in the 16-mile range.
- (2) Turn the gain control clockwise and the A.C.Sea clutter knob counterclockwise on the display unit as far as they will go.
- (3) Press the FUNC and IR keys to turn off the interference rejection (IR) mode. Some noise will now appear on the screen. If not, adjust VR155 on the adjustment board (Refer to Fig. 51).
- (4) Check that the noise disappears from the screen when the gain knob position is set to within the 2 to 4 o'clock direction.

4-5 Magnetron Current Monitor (Check Only)

- 1) Operate the radar and set it to the transmit mode.
- 2) Use a multimeter (for DC voltage measurement) to measure the voltage between TP801 and TP2 (Refer to Fig. 54).
- 3) Check that the monitor voltage is as follows in the long range mode.

	Voltage between TP801 and TP2
Long mode	1.0 to 2.0 VDC

4-6 Magnetron heater voltage

(Check only upon installation and when magnetron is replaced.)

Check the following before attaching the top cover of the radome

- Set the radar to the standby mode.
 (Under no circumstances should it be set to the transmit mode.)
- 2) Use a multimeter (for DC voltage measurement) to measure the voltage across between TP3 and TP4, and check that the voltage is between 5.7 to 6.9 VDC.

Transmitter P.C. Board (PQUP1005ZA-a)

Fig. 54

4-7 Tuning indicator Display Level Adjustment

Preparation

Set the range 16 NM by using the Range up/down key(s).

Set the radar to the transmit mode and turn the TUNE knob to obtain the maximum, indication on the tune indicator so that a target at a long distance is clearly visible. If necessary, adjust the receiver sensitivity using the GAIN knob.

Adjustment

Turn the TUNE IND LEVEL control in the preset window slowly from left to right and set it where level 5 is indicated on the tuning display.

Then move the same control slowly until just before the indicator lights up the indicator for level 6.

4-8 External Alarm Speaker Volume Adjustment

(Perform only when an external speaker is connected.)

Operate the radar and set the alarm zone so as to include echo signals.

(Set the zone using EBL1 and 2 and VRM1 and 2, and press ALARM. Check that the "ALARM" message appears on the CRT. If it does not appear, press ALARM again.)

Use VR151 on the adjust board to adjust the volume to an appropriate level (Refer to Fig. 51).

4-9 DC-DC Converter

Adjustment procedure:

- 1. Operate the radar.
- 2. Use a multimeter (for DC voltage measurement) to check the output voltages listed in the table below.

	Monitor CN301 of Pow	er Supply Board or CN1 of Processor Board	Voltages as measured to the unit's ground
+12V	CN301 pin6	CN1 pin6 of Processor Board	12.0V to 12.2V
-12V	CN301 pin8	CN1 pin8 of Processor Board	11.9V to 12.3V
+12V (M)	CN301 pin3	CN1 pin3 of Proccessor Board	11.7V to 11.9V
+5V	CN301 pin5	CN1 pin5 of Proccessor Board	4.75V to 5.25V

If any of the measured values deviate from what is listed above, adjust VR302.

- 3. Use a frequency counter to check that the output frequency at IC301 pin5 is 90 kHz ± 0.5 kHz.
- 4. Excessive input protection check

Carry out the following check when the DC-DC converter is replaced: gradually increase the primary DC supply voltage to the radar, and when it has exceeded 42V to 44V, check that the JP342 oscillator waveform stops and that the radar itself stops operating.

Power Supply P.C. Board (PQUP1097ZA)

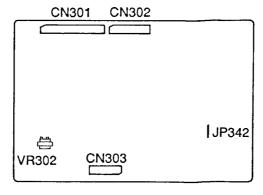

Fig. 55

4-10 Video Leveling Threshold Adjustment

- (1) Use a multimeter (for DC voltage measurement) to read out the value at pin 12 of IC13 on the signal processor board.
- (2) Adjust VR1 so that the reading on the multimeter indicates between 0.35 V and 0.40 VDC.

Signal Processor P.C. Board (PQUP1107ZA)

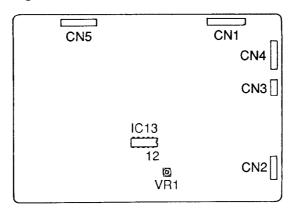

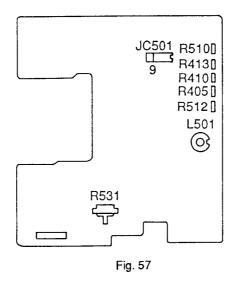

Fig. 56

4-12-1 Vertical Sweep Frequency Adjustment

- (1) Proceed with the following adjustment to correct sync misalignment.
- (2) Rotate R405 in both the clockwise and counterclockwise directions, and set the control to virtually the center of both points where sync misalignment starts to appear on the screen.

4-12-2 Display Horizontal Sweep Frequency Adjustment

- o Use a counter to measure the frequency at pin 9 of IC501 on the display board.
- o Adjust R512 to set the frequency to between 23.825 kHz and 24.825 kHz.

4-12-3 Sweep Origin Position

- (1) Proceed to transmit radar signals and press the BRILL key to adjust the brightness at the CRT sweep center position to the appropriate level.
- (2) Rotate the GAIN control and set it so that a very low level of brightness dot at the center of the screen is achieved.
- (3) Adjust the magnet ring on the neck of the CRT so that the sweep center comes to within a 1/16" radius of the center of the CRT.

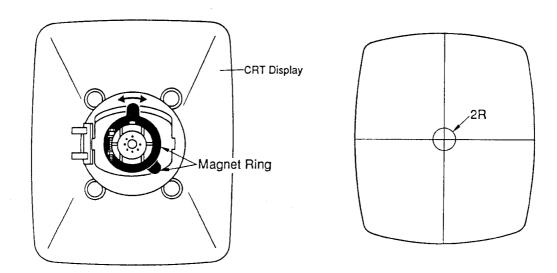

Fig. 58

4-12-4 Horizontal / Vertical Screen Size and Linearity Adjustments:

Adjust L501 and R410 to achieve the following values for the horizontal width (W) and vertical width (H) of the display screen.

W: 3 5/8" to 3 13/16" (92 to 97 mm)

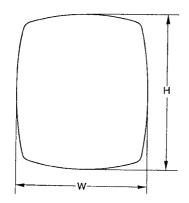

H: 47/8" to 5 1/8" (124 to 130 mm)

Adjust VR413 so that x1, x2, y1 and y2 of the screen come within the following ranges:

 $x1 = x2 \ 1 \ 13/16$ " to 1 7/8" (46 to 48.5 mm)

y1 = y2 2 7/16" to 2 9/16" (62 to 65 mm)

CRT display screen

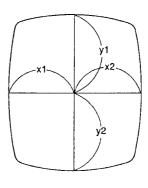

Fig. 59

4-12-5 Brightness Adjustment:

- 1) Operate the radar.
- 2) Turn the GAIN control on the display unit clockwise as far as it will go and press the BRILL button to establish the maximum brightness mode.
- 3) In a dark place (if possible) attach a hood, watch the screen and adjust R510 to a level where the retrace is no longer seen in the no-signal areas (areas without characters or images).

4-12-6 Focus Adjustment

- 1) Operate the radar and observe a suitable target on the display.
- 2) Adjust R531 on the display board so that the focus is optimized.

 When adjusting the focus, remove the heat sink and power supply board (keep the connectors connected), and adjust R531 as shown bellow.

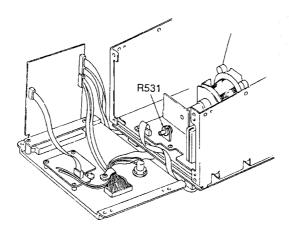

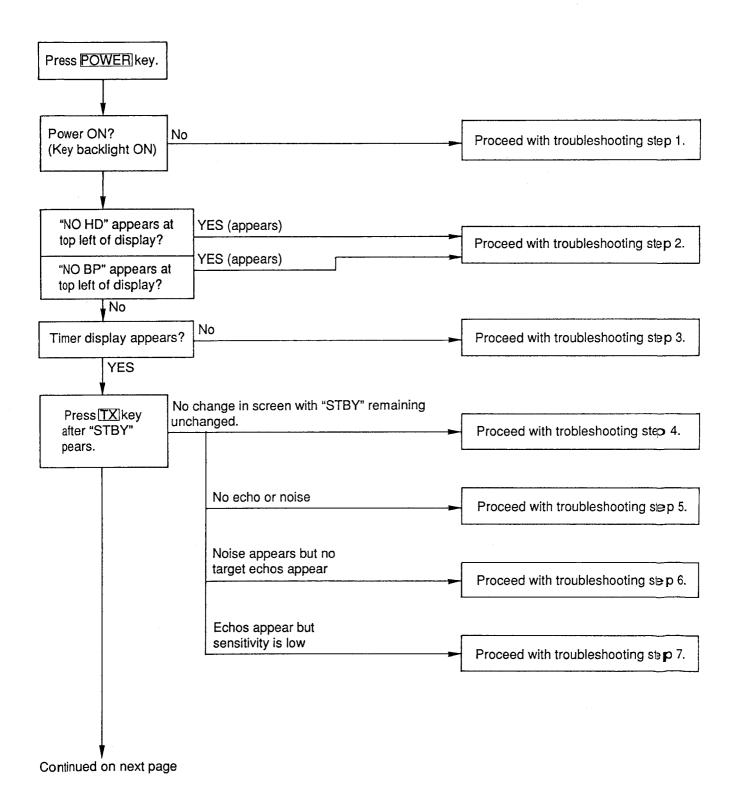

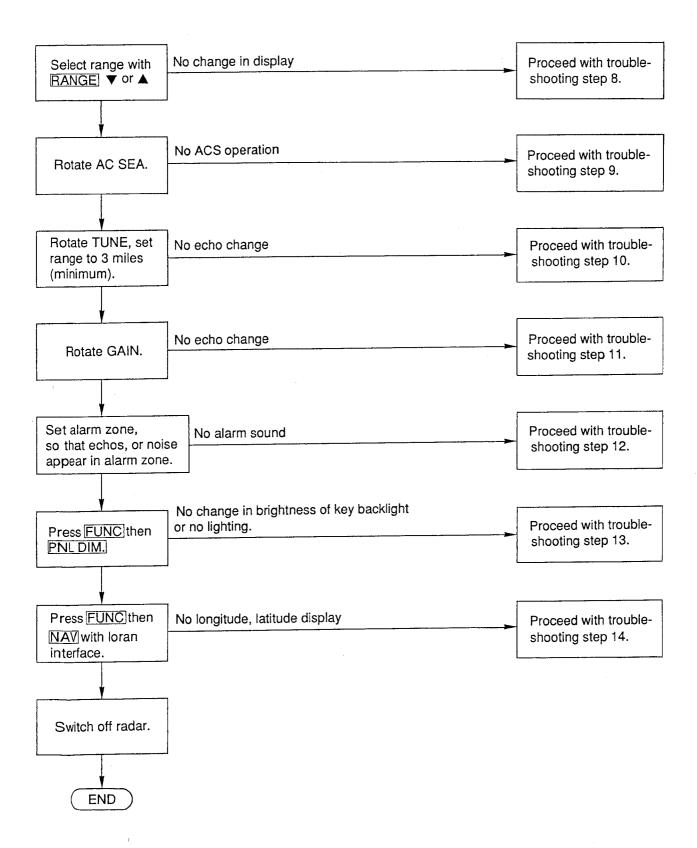

Fig. 60

5. TROUBLESHOOTING GUIDE

5-1 Troubleshooting Flowchart

5.2 Troubleshooting Guide

Troubleshooting Step 1: No power.

Major Causes:

- o Blown fuse (F301)
- o Vessel battery voltage too high or too low
- o Broken connections in power cable or short circuit
- o Failure on power supply board

Note:

Before checking the P.C. board in the antenna unit, remove the motor set screw, and move the motor to prevent the antenna from rotating.

Also, rotate the antenna by hand from time to time in order to generate a heading signal and apply a reset signal to the signal MPX circuit.

Checks and Repairs

- 1) Check fuse F301 and replace it (10A) if it has blown.
- 2) Check the input supply voltage.

Check Point	Rating
Between power cable connector pins 1, 2	10.8 to 42 VDC
Between CN351 pins 1, 2	10.8 to 42 VDC

- 3) Disconnect the signal cable connector and switch on the power. If the power does not come on or if the fuse "blows," the problem may lie with the power supply board.
- 4) If power is supplied when the signal cable connector is disconnected, the overload protector in the antenna unit has been tripped. Check out the antenna unit following the troubleshooting procedure.
- 5) If the voltage between CN303 pins 1 to 4 is normal (10.8 to 42 VDC), check the voltage between the pins below:

Check point	Raiting
CN301 Pins 7 and 6: Approx.	+12VDC
Pins 9 and 6: Approx.	-12VDC
Pins 8 and 6: Approx.	+5VDC

Replace the power supply board if output voltage is not supplied.

Troubleshooting Step 2: "NO HD" or "NO BP" appears.

Possible Causes

- o Trouble with the connections of the signal cable connectors (looseness, etc.)
- o Trouble with the CN2 connections on the processor board (looseness, etc.)
- o Failure of motor inside antenna unit
- o Failure of antenna rotation mechanism
- Missing magnet for heading detection of antenna

Checks and Repairs

- When both "NO HD" and "NO BP" appear, improper connection or a motor failure may be to blame. Check for looseness in the signal cable connections and connector CN2 connections on the processor board.
- o Switch off the power and remove the antenna radome cover.
- o When only "NO HD" appears, check whether the magnet for detecting the heading is missing and also check the connector CN804 connection. (See Fig. 53)
- o Try rotating the antenna by hand. If it does not turn smoothly, check for damage to the gears and replace if necessary.
- o If the antenna rotates smoothly by hand, a failure in the motor or motor drive section may be to blame.
- Check the voltage across pins 1 and 2 of connector CN801 on the modulator board. If the voltage is not about 12 VDC, the motor is defective and should be replaced.
 If the voltage is not observed, check the voltage across pins 1 and 3 of connector CN805 on the modulator board. If it is about 12V, the modulator board is defective and should be replaced.

Troubleshooting Step 3: Nothing appears on screen.

Possible Causes

- o CRT high-voltage system failure
- o Processor board failure
- CRT failure

Checks and Repairs

- 1) Check that the CRT filament lights. Adjust the R510 brightness control on the display board.
- 2) If the display does not appear even after the adjustment in 1), check the high-voltage circuit following the steps below.
 - a) Switch off the power and, taking care not to receive an electric shock from the high voltage, pull out the CRT anode cap. (Do not touch the electrodes.)
 - b) Bring the anode cap electrode to a position about 3/16" from the chassis (metal part). If the high-voltage system is problem-free, a spark will jump between the chassis and electrode.
- 3) Check the vertical and horizontal sync pulses using a osilloscope. If they are not present, there is a failure on the processor board.

Vertical sync pulse (connector CN4-3 on processor board)

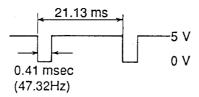

Fig. 61

Horizontal sync pulse (connector CN4 pin 4 on processor board)

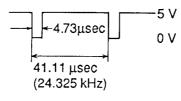

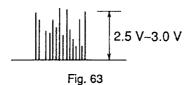

Fig. 62

4) Use the oscilloscope to observe the signal at pin 1 of connector CN4 on the processor board. A pulsed random signal, such as that shown in the figure below, should appear. Approx. 5Vp-p

5) If there is no problem with the checks in 1), 2), 3) and 4) above, the CRT is malfunctioning and should be replaced.

Troubleshooting Step 4: STBY mode remains even when "TX" is pressed.

Possible Causes

- o Control board failure
- o Improper connection of connector CN6 on processor board

Checks and Repairs

- 1) Check whether the CN6 connector on the processor board is loose.
- 2) Observe the signal of pin 5 of the same CN6 connector on an oscilloscope. Check that a pulse train (approx. 100 Hz, 5Vp-p) is observed while the TX key is kept pressed. If the pulse train does not appear, the problem may lie in the control board which should be replaced.

Troubleshooting Step 5: No echos or noise on the screen.

Possible Causes

- 1) Problem with video signal connections (open or short)
- 2) IF amplifier board failure
- 3) Processor board failure

Checks and Repairs

- 1) Use a multimeter to check the connections (for continuity/shortcircuiting) of the video signal line in the signal cable connecting the antenna and display units.
- 2) Use the oscilloscope to check the waveforms at pin 5 of connector CN2 on the processor board. A signal such as that shown below should be observed.

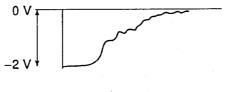

Fig. 64

If a signal simular to the above signal is not observed even when the TUNE, A.C. Sea and GAIN controls of the display unit are adjusted, the problem may lie with the IF amplifier board which should be replaced.

3) When the above signal appears normal and no echoes and noise appear on the screen, the problem may lie with the processor board which should be replaced.

Troubleshooting Step 6: Noise appears but no echoes.

Possible Causes

- o Processor Board failure
- o FET Q806 failure
- o Magnetron failure or it has reached the end of its service life
- Pulse width control circuit failure
- o Pulse transformer T801 failure
- o MIC failure

Checks and Repairs

- 1) Set the radar to the transmit mode, and use a multimeter to monitor the voltage at the magnetron current monitor point TP801 on the receiver P.C. board.
 - Monitor voltage
 - If the voltage is between 1.0 and 2.0 VDC (at 4NM range) the problem may lie with MIC which should be replaced.
- 2) If the magnetron current monitor value is not normal, set the radar to the standby mode and measure the heater voltage at CN806.
 - Heater voltage: 5.7 to 6.9 VDC
- 3) If the heater voltage is normal and the magnetron current monitor signal cannot be obtained, check the signal at trigger output CN2 pin 1 on the processor board.

Fig. 65

When this signal cannot be obtained in the transmit mode, the problem may lie in the processor board.

- 4) If the trigger pulse is generated by the processor board, check the modulator board as follows.
 - i) Confirm that the Q806 drain voltage 350 VDC in standly (transmit OFF) condition.
 - ii) Set the unit to transmit mode, at 4NM range, and confirm the trigger pulse at below points.

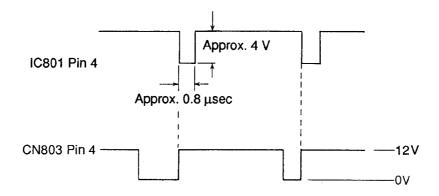

Fig. 66

If the signal at CN803 pin 4 is generated and the signal at IC801 pin 4 is not present, the trigger circuit (Q801, IC801) may be faulty.

iii) If the signal at IC801 pin 4 is present, the Q806 or pulse modulator circuit may be faulty.

Troubleshooting Step 7: Echos appear but low sensitivity.

Causes

- o Trouble in MIC 5V regulator (IF amplifier Q610)
- o MIC failure
- o End of magnetron's service life

Checks and Repairs

- 1) Check that the voltage at connector to MIC pin 4 from the IF amplifier is $5V \pm 0.2V$. If it deviates greatly from 5V, the power regulator Q610 circuit may have failed.
- 2) Check the magnetron current using the procedure in troubleshooting step 6-(1). If there is a problem, the magnetron may have reached the end of its service life and should be replaced.

Troubleshooting Step 8: No change in range with range Up / Down Key (Range ▼) (Range ▲

Possible Causes

- Improper connection of connector CN6 on the processor board
- o Control board failure

Checks and Repairs

- 1) Check the connector CN6 connections on the processor board.
- 2) Use an oscilloscope to check the signals at pins 8 and 9 of connector CN6 on the processor board (100 Hz, 5Vp-p pulse train). If the signal does not appear, the processor board has failed.
- 3) Use an oscilloscope to check the signal at pin 6 of connector CN6 on the processor board. Check that a pulse train (approx. 100 Hz, 5Vp-p) appears while the key is pressed. If it does not appear, the control panel has failed.

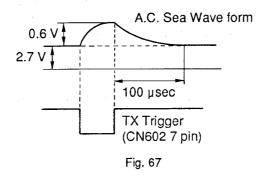

Troubleshooting Step 9: No A.C. Sea operation.

Possible Causes

- o Improper connection of CN205 on the control board
- Improper connection of CN151 on preset board
- o IF amplifier A.C. SEA circuit Q609 failure

Checks

- Check the voltage at pin 12 of IC49 on the processor board.
 Rotate the A.C. Sea control and check that the voltage changes between approximately 6.5 V and 8 Vdc.
 - If the voltage does not change, check the connections of CN151 on the preset board and of the CN205 on the control board.
- 2) Check the waveform at pin 3 of IC602 on the IF amplifier board. The conditions at this time are:
- Radar in the transmit mode
- o GAIN control clockwise as far as it will go
 If the A.C. Sea waveform is not observed, it means that the IF amplifier A.C.Sea circuit has failed.

Troubleshooting Step 10: No change in echo even when TUNE control knob is turned.

Possible Causes

- Improper connection of VR201 on the control board and of VR154 on preset board
- o Failure of tuning circuit (IC604, Q611) on IF amplifier board
- o MIC failure

Checks

- 1) Check the voltage at pin 13 of the IC49 on the processor board. When the TUNE (VR201) control is turned, the voltage should change across a range from about 0 to 6 VDC. If it does not change, check the connections of the VR201 control.
- 2) Check the voltage at pin 14 of the IC49 on the processor board. When VR154 on the preset board is turned, the voltage should change across a range from about 0 to 7 VDC. If it does not change, check the connections of the VR154 control.
- 3) Check the voltage at pin 4 of connector to MIC on the IF amplifier. When VR154 on the preset board is turned, the pin 5 voltage should change across a range from about 3 to 25 VDC.
- 4) When the TUNE control is turned, the connector CN601 pin 4 voltage should change by a margin of about 2 V or more.
- 5) The tuning circuit of the IF amplifier has failed if the desired results are not obtained in 3) or 4).
- 6) When the desired results are obtained in 3) and 4), a MIC failure is assumed if a 5V supply voltage is supplied to pin 3 of the CN601.

Troubleshooting step 11: No change in echo or noise even when GAIN cotrol is adjusted.

Possible Causes

- o Improper connection of GAIN control, VR155 on preset board
- o IF amplifier failure

Checks

- 1) Check the voltage at pin 15 of IC49 on the processor board. It should change to approx. 8 to 9.5 Vdc when the GAIN control is turned. If there is no change, check the connections at the GAIN control and of VR155 on the preset board.
- 2) Check the voltage at connector CN602 pin 9 of the IF amplifier. If there is the same change as in 1), the IF amplifier may have failed.

Troubleshooting step 12: No alarm tone.

Causes

- o Failure of alarm amplifier circuit (Q11) on processor board
- o Failure of alarm amplifier circuit (Q4, Q22, Q24) on processor board
- o Failure of alarm circuit (IC29) on processor board
- o Improper connection of VR151 on preset board
- Improper connection of external speaker

Checks

(Set the alarm zone and proceed in the alarm mode.)

- 1) If the built-in alarm is problem-free and no sound is heard through the external speaker (option), check the external speaker connections.
- 2) Use an oscilloscope to check the signal of wire W1 #6 on the processor board. It should be pos sible to observe a pulse train (approx. 2 kHz, 5Vp-p). If this signal is not present, the processor board has failed.
- 3) If the signal in 2) is problem-free, check the wire W1 #7 signal. If a pulse train (approx. 2 kHz, 2Vp-p) is not observed even when VR151 on the preset board is turned clockwise, check the VR151 connections on the preset board.
- 4) Check that the signal in 3) is problem-free and check the signal at connector CN7 pin 1 for the external speaker. If a pulse train (2 kHz, 5Vp-p) is not observed, the amplifier circuit (Q4, Q22, Q24) on the processor board has failed.
- 5) Use the oscilloscope to observe the signal of IC31 pin 63 on the processor board. A pulse train (5Vp-p, 2 kHz) should appear. If not, the processor board has failed.
- 6) Use an oscilloscope to observe the signal of cable W2 #2 for connecting the buzzer element. A signal (approx. 3Vp-p, 2 kHz) should be observed. If the signal is present, the element has failed; If it is not present, Q11 on the processor board has failed.

Troubleshooting step 13: No change in key backlight brightness or no lighting.

Possible causes

- o Open filament in lamps PL201-206
- o Control panel Q201 failure
- Processor board TR5 failure
- Processor board IC27 failure
- Key switch failure

Checks

- 1) When the backlight does not come on, connect the emitter of Q201 on the control board to GND. An open filament in a lamp is to blame if the lamps do not light.
- 2) Monitor pin 3 of connector CN6 on the processor board. A pulse train (approx. 100 Hz, 5Vp-p) should be observed while the PNL DIM key is kept pressed. If it is not observed, the control board has failed.

3) Use an oscilloscope to monitor the waveform at IC27 pin 17 (OUT2).

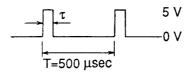

Fig. 68

Check that the duty cycle of the above signal changes each time the dimmer key is pressed. If it dose not change, it means that IC27 has failed.

4) Use an oscilloscope to observe the signal at pin 3 of connector CN5 on the processor board.

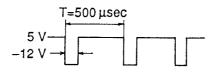

Fig. 69

Check that the duty cycle of the above signal changes each time the dimmer key is pressed. If it changes, it means that transistor Q201 on the control board has failed; if not, it means that Q5 on the processor board has failed.

Troubleshooting Step 14: No longitude, latitude display even when set to navigation mode.

Possible Causes

- o Improper operation of externally connected loran system
- o Improper connection of interface cable with loran system
- o Failure of photocoupler IC44 used for interface
- Microcomputer IC1 failure

Checks

- 1) Check that the loran system is functioning properly.
- 2) Check that the proper connections have been made with connectors CN303 and CN3.
- 3) Use an oscilloscope to check the signal at IC1 pin 55. A 5Vp-p pulse train should be observed. If it is not observed, photocoupler IC44 has failed; if it is observed, IC1 on the processor board has failed.

TOOLS FOR SERVICING

Special tools which are made of copper beryllium (non magnetic) for servicing the antenna unit (Model KX-G8100DM).

	Part No.	Part Name
(A)	PQZZ1G8300M	+Screwdriver for M3 screws
B	PQZZ2G8300M	+Screwdriver for M4 screws
©	PQZZ3G8300M	Electrician's pliers
